

Position Paper

Country: Japan

Topic Area: Cyber Terrorism

Delegate: Salman Khan

The Challenge

Cyber Terrorism¹ is a form of technological crime committed on a magnitude of scales, ranging from robbery to governmental sabotage. Cyber terrorism is defined by the Technolytics Institute² as “The premeditated use of disruptive activities, or the threat thereof, against computers and/or networks, with the intention to cause harm or further social, ideological, religious, political or similar objectives. Or to intimidate any person in furtherance of such objectives.” Such a definition makes cyber terrorism a broad subject that requires attention. Since there are a multitude of issues, Japan feels a great responsibility to assist in any way possible as Japan has an updated cyber security response team and several acts pertaining to this situation.

Japan’s Position

Japan is proud to state that several policies are already in place. Japan has had a Computer Emergency Response Team³ since 1996 and adopted a national cybersecurity strategy in 2013. As of 2014, the Basic Law on Cybersecurity ACT⁴ was made publicly available. This act requires all corporations and organisations to boost cybersecurity initiatives and administers harsher penalties towards offenders. This act also requires that the government take an initiative to educate adolescents and employees on cyber security measures and requires that the government take measures to improve the skills of people working in the cybersecurity field.

Japan’s Proposals

- Japan firstly suggests lesser technologically developed nations follow in its example.
- Japan also suggests that the roots of many cyber attacks come from human error. Therefore, Japan suggests that a certain amount of investment goes into researching technologically advanced software and hardware that may replace certain, cybernetic low-level jobs.
- Japan also promotes the idea of maintaining a global league to share cyber technical advances, successes and to do research through UN investment.
- Japan suggests that UN nations form a standard level of acceptance, limiting both surveillance and technological limits.
